

Costumized solutions for the treatment of waste from processing

Paper CUTTERS

TRM

Cutter suitable for shredding the trimmings on board of the machine, whether they are plastic, paper or coupled with aluminum.

Its ideal application is in combination with a centralized extraction system.

The "TRM" cutter is a machine studied and designed to be included in suction systems serving machines that produce tough trimmings such as plastic films for packaging, polythene and coupled with aluminium. Entirely processed with precision mechanics, it performs the task of trims shredding on the machine, making the trims pneumatically transportable.

It consists of two blades with double cutting edge in WIDIA, mounted on a hollow rotor coupled directly to the electric power motor, and a fixed blade with double cutting profile in adjustable WIDIA.

All the blades can be removed and sharpened.
